

RELAUNCH: SECURE-Liver & COVID-Hep 2.0 registries

We are pleased relaunch the collaborative registries **SECURE-Liver** (formerly SECURE-Cirrhosis) and **COVID-Hep 2.0** alongside **full endorsement from AASLD and EASL** respectively.

The registries have already helped characterize the COVID-19 disease course patients with liver disease and transplantation. **However, there are now new important questions.** We have therefore **modified the case report form** to investigate the following:

- COVID-19 vaccine uptake and characteristics of post-vaccination SARS-CoV-2 infection
- Impact of emerging SARS-CoV-2 variants
- Effect of alcohol consumption on COVID-19 disease course
- Rates and management of thromboembolic disease
- COVID-19 in under-served / safety net populations

Please upload non-identifiable data in less than 5 minutes for any patient with CLD or liver transplantation and laboratory proven COVID-19

Every individual and center that submits at least one case will be acknowledged and **major contributing centers will be invited to form part of the co-authorship on future publications.**
